

# Easy solution for dry berthing boats

**UPLIFTING:** With an AirBerth Lift, boats are kept high and dry, well above the waterline and away from the effects of osmosis and electrolysis

**IF** you are tired of all the maintenance issues associated with keeping your boat in the water, AirBerth Boat Lifts have risen to the occasion.

Constructed almost entirely out of HDPE, their boat lifts are designed to last a lifetime.

With an AirBerth boats are kept high and dry well above the waterline away from the effects of osmosis and electrolysis.

It simply attaches to a floating pontoon, jetty or marina berth with no permanent fixtures.

AirBerth puts boat owners firmly in control.

Simply direct the boat in between both mooring guides and idle the vessel in.

The mooring guides will automatically center the boat.

Hook both positioning ropes onto the rear cleats of the boat, then connect AirBerth's portable

blower box to commence the lifting process.

As the front of the AirBerth rises the boat slides back and tensions the two positioning ropes, ensuring the boat is at the correct longitudinal center of gravity on the AirBerth.

The rear then rises up to take load completing the lifting process.
