

The AirBerth is easy to use: point the nose between the two mooring guides and the boat will self-centre. The AirBerth features the patented flexible cradle system, which enables the cradle to shape to the hull, and compression pads which give cushioned support towards the transom to eliminate point loading. The AirBerth is constructed of high density polyethylene, which is non-corrosive and has high UV stability. There are 10 standard models in the AirBerth range, from 1,500kg up to 11,000kg, including models for monohulls, planing and power catamarans.
